Description

We have been working with a lot of subsystems of the Real Office System ,all of them play a key role in modelling and developing the Software system but a reporting system mostly defines the strength of a system based on how widely it can be used.For the Real Office System this can be evaluated in the diversity and the usefulness of the queries supported .Here are some example queries that can implemented with ease:

- **Find the number of times a venue was used/Find most/least used venue:** Identify problems with a venue

- **List of all the lectures given by guests:** Data can be used to track exposure to others views here in CSE department.

- **Month with most number of events:** This data can be used to plan other activities in department next semester
